

## **Instructions:**

The set of questions serves as PILOT practices to final exam for the Spring 2025 term of AS.110.302 Differential Equations and Applications at Johns Hopkins University.

- The questions are designed to be done without notes and calculators.
- Solutions to selected questions will be discussed during the PILOT review session.
- Note that the final is <u>cumulative</u>, while this practice set only contains materials after the second midterm. Please refer to Midterm 1 and 2 Practices for materials covered in the first two midterms.
- 1. Let systems of differential equations be defined as follows, find the general solutions to the equations:

(a) 
$$\mathbf{x}' = \begin{pmatrix} 3 & 0 \\ 0 & 2 \end{pmatrix} \mathbf{x}, \qquad \mathbf{x} = (x_1, x_2).$$

(b)  $\mathbf{x}' = \begin{pmatrix} 3 & -2 \\ 4 & 1 \end{pmatrix}, \quad \mathbf{x} = (x_1, x_2).$ 

(c) 
$$\mathbf{x}' = \begin{pmatrix} 1 & 0 & 4 \\ 1 & 1 & 3 \\ 0 & 4 & 1 \end{pmatrix} \mathbf{x}, \quad \mathbf{x} = (x_1, x_2, x_3)$$

2. Solve the following initial value problem:

$$\mathbf{x}' = \begin{pmatrix} 1 & -4 \\ 4 & -7 \end{pmatrix} \mathbf{x}, \qquad \mathbf{x}(0) = \begin{pmatrix} 3 \\ 2 \end{pmatrix}.$$

3. For the following non-linear systems, find all equilibrium(s) and classify their stability locally.

( day

(a)  

$$\begin{cases}
\frac{dx}{dt} = x - y^2, \\
\frac{dy}{dt} = x + x^2 - 2y. \\
\frac{dx}{dt} = 2x + 3y^2, \\
\frac{dy}{dt} = x + 4y^2.
\end{cases}$$

4. Let a system of equations for  $\mathbf{x} = (x_1, x_2) \in \mathbb{R}^2$  be:

$$\mathbf{x}' = \begin{pmatrix} F(\mathbf{x}) \\ F(\mathbf{x}) \end{pmatrix}$$

Suppose that  $F(x_1, x_2) = \sin x_1 + \csc(3x_2)$ .

- (a) Find the set of all equilibrium(s) for  $\mathbf{x}$ .
- (b) Find the set in which the equilibrium(s) is locally linear.
- Now,  $F : \mathbb{R}^2 \to \mathbb{R}$  is not necessarily well-behaved.
- (c) Construct a function *F* such that **x** has a equilibrium that is <u>not</u> locally linear. *Hint:* Consider the condition in which a non-linear system is locally linear.
- 5. Let the following systems of (x, y) be functions of variable *t*:

(a)  

$$\begin{cases} x' = (1+x) \sin y, \\ y' = 1 - x - \cos y. \end{cases}$$
(b)  

$$\begin{cases} x' = x - y, \\ y' = x - 2y + x^2. \end{cases}$$

Identify the corresponding linear system, then evaluate the stability for the equilibrium at (0,0) by showing it is locally linear.

6. Determine the periodic solution, if there are any, of the following system:

$$\begin{cases} x' = y + \frac{x}{\sqrt{x^2 + y^2}} (x^2 + y^2 - 2), \\ y' = -x + \frac{y}{\sqrt{x^2 + y^2}} (x^2 + y^2 - 2). \end{cases}$$
